

Project 1st : Fake face detection

Problem statement:

Fake videos can now be created using a machine learning technique called a “generative adversarial network”, or a GAN. A graduate student, Ian Goodfellow, invented GANs in 2014 as a way to algorithmically generate new types of data out of existing data sets. This technique can help us in many ways but there is always an opposite side of any technology in this world. Today people are using GAN for frauds like, they can easily make false identities. And this will also affect areas like media. Because fake news can easily generate chaos in the society. And fake facial images play a major role in this. so we know that we have the technology now to generate random faces which looks like real but we also have the same technology which can help us in solving this problem and that is machine learning.

The resources used in this project

1. For the fake facial image data set i used the 1 million fake face data set which i got from the link.

<https://archive.org/download/1mFakeFaces>

1. For the real facial image data set i used celeb_hq data set in the size of 256x256 from the given link.

https://www.tensorflow.org/datasets/catalog/celeb_a_hq

1. I implemented the Research paper to solve this problem. with some modification for this problem.

<https://www.mdpi.com/2076-3417/8/12/2610/htm>

1. And for the improvement of the model i used another new technique called as gram block mention in this research paper.

16. Upgrading the CG_Face with introducing the gram block

The concept of gram block is taken from this research paper <https://openreview.net/forum?id=HyxcZT4KwB>

IN the paper they found that for the facial image classification the texture features play an important role due to this they introduced the gram block in their existing resnet architecture and they found that gram block increased the performance of the resnet on the facial image data.

Final Observation:

- The first key take away from this experiment is, there is not always complex and higher layer cnn works better since we are getting good result with our CG_Face model which is less complex and have the low no. of cnn layers in comparision with the vgg16. CG_Face face also working with low resolutions because for models we took 64 input shape
- From the experiment with the gram block we got to know that for the facial image classification problem texture feature is actually important because it is now proven after the experiment that it enhances the power of a CNN model to an extent
